ABSTRACT

Food security at the state level is an extremely important aspect of total national security. It is extremely challenging for each state to maintain and increase it in the conditions of world economic globalization. At present, the issue of sustaining this direction of security in Russia, which joined the World Trade Organization back in 2012, is quite relevant. At the level of the country, it is extremely important to systematically analyze food security in terms of its retention and increase within the processes of globalization. The assessment of the evolutionary flow, reflecting the irreversibility, instability, imbalance of changes occurring in the economic space, also occupies an important place. The study reflects and unveils the issue of prospective retention and enhancement of Russian food security in the conditions of operation within the World Trade Organization. The current threats to the Russian economy from this trade agreement are noted. At the same time, potential ways for the state to improve food security, given the acuteness of the problem in the field of food at the global level, are highlighted.

Keywords: Food security, World Trade Organization, agro-industrial sector, agro-industrial production capabilities, personal consumption.
